

TO INSTALL THE LICENSE KEYS ON THE SERVER MACHINE(S):

1. Save the license file to the directory and filename of your choice. My personal preference is some place like

**\Program Files\Ansys Inc\license.lic**

(Many have asked what file extension they need to use. It does not matter. You may use txt, dat, lic or anything else! As long as the path and filename in #3 below are correct, things should work.)

2. On the license server machine, start the License Manager software. On Windows, this can be done by

**Start >> Programs >> ANSYS Flexlm License Manager >> ANSLIC\_ADMIN Utility**

Another panel will appear in the middle of the screen

3. Click on "**Install the License File**" and browse to the file that you just saved in step 1 above.

4. Click on "**Start the License Manager**"

You should now be able to run Ansys/Workbench. If not, a reboot of the server machine usually clears up the difficulty.
